

Edgar Filing: SENESCO TECHNOLOGIES INC - Form 8-K

Check the appropriate box below if the Form 8-K is intended to simultaneously satisfy the filing obligation of the registrant under any of the following provisions:

Written communications pursuant to Rule 425 under the Securities Act (17 CFR 230.425).

Soliciting material pursuant to Rule 14a-12 under the Exchange Act (17 CFR 240.14a-12).

Pre-commencement communications pursuant to Rule 14d-2(b) under the Exchange Act (17 CFR 240.14d-2(b)).

Pre-commencement communications pursuant to Rule 13e-4(c) under the Exchange Act (17 CFR 240.13e-4(c)).

Item 8.01 Other Events.

On March 1, 2012, Senesco Technologies, Inc. (the “Company”) issued a press release announcing that it has received Institutional Review Board approval and has finalized a clinical trial research agreement with the University of Arkansas for Medical Sciences (“UAMS”) in Little Rock, Arkansas to evaluate SNS01-T, the Company’s lead therapeutic candidate for the treatment of multiple myeloma in the on-going Phase 1b/2a study.

The University of Arkansas for Medical Sciences (“UAMS”) is one of the region's major academic health centers, located in Little Rock, Arkansas, with outreach programs operating in every county and a regional campus in Northwest Arkansas. The principal investigator in the study at UAMS is Saad Usmani, M.D., Director of Developmental Therapeutics in the Myeloma Institute for Research & Therapy.

In the study, patients are dosed twice-weekly for 6 weeks followed by an observation period. The first group of three patients will receive 0.0125 mg/kg by intravenous infusion. At the end of their 6 weeks of dosing, safety data for the group will be reviewed before the subsequent group receives a higher dosage. The escalated doses administered to the second to fourth groups will be 0.05, 0.2 and 0.375 mg/kg, respectively. The study is an open-label, multiple-dose, dose-escalation study, which will evaluate the safety and tolerability of SNS01-T when administered by intravenous infusion to a total of approximately 15 relapsed or refractory multiple myeloma patients. While the primary objective of this study is to evaluate safety and tolerability, the effect of SNS01-T on tumor response and time to relapse or progression will be assessed using multiple well-established metrics including measurement of the monoclonal protein (M-protein). Patient dosing in the study was initiated in November, 2011 at the Mayo Clinic in Rochester, Minnesota.
